

REPLY TO THE DOCUMENT OF 18 SEPTEMBER

Your popup is right. Our document was wrong.

You asked one question above the others: is `questionStyle: "on-screen"` correct, or are 17 rows mis-classified? **The data is correct and your filter is correct.** What was wrong is the specification we gave you — it is built end to end around `autonomy-01-spectrum`, a video that predates the popup entirely. You built to the document, and the document demonstrated the feature on the one kind of video where it must not fire. That is ours, and it is fixed in the copy attached.

And the contradiction you found was a real bug. It is fixed.

You reported a checkpoint carrying `pausesVideo: false` together with `requiresAnswer: true, allowSkip: false`, and said the two cannot both be honoured. They cannot. Our on-screen branch overrode `pausesVideo` and left the other three standing, so every consumer had to guess which field won — and you guessed correctly. A question the video draws for itself now relaxes all four together: `requiresAnswer: false, blocking: false, allowSkip: true`. A test now walks every checkpoint in the catalogue and fails if any of them disagree.

1 · Is the popup for the existing catalogue, or only new videos?

Only for videos in the new format — and that is not a limitation, it is what the two formats mean.

FORMAT	WHAT THE LEARNER SEES, AND WHAT YOUR PLAYER MUST DO
<code>popup</code> 13 rows	Nothing is drawn and nothing is spoken. The popup is the only place the question exists — suppress it and the learner misses it entirely. Pause, require an answer, show the feedback, resume. This is every video we make now.
<code>on-screen</code> 18 rows	The question and its answer are drawn into the video as a card pair. The learner reads the question, the video holds it on screen, then the video answers it. Firing a popup over these asks the same question twice and then spoils it. <code>onScreenUntilSeconds</code> tells you how long the card is legible if you would rather overlay than stop.

So on today's data the feature you shipped is working as intended. The number will move in your favour without you changing anything: five finished `notion-slack` videos are waiting to deploy, all `popup`, which takes the split from 13/31 to 18/36. Re-cutting the 18 older ones to strip their drawn cards is real render spend for no new teaching, so we are not proposing it — but if you would rather have one consistent behaviour across the catalogue, say so and we will price it.

2 · Is a course durable? Now yes — and here is the handoff

You were right to answer this one first, and right that the sentence decided the design. Three things were true, and two of them were worse than the error message said.

The handoff exists. It has existed since 11 September. We never sent it.

The error message cited a document that was written, rendered and then left in a folder. It is attached now as **Course-Builder-Technical.pdf** — five pages covering `plan`, `build` and `status`, with request and response bodies, the `confirmLessons` guard, the error table and the limits. You should not have had to ask three times for something that was already finished.

The durability itself is now real rather than disclaimed:

WHAT WE FOUND	WHAT IT DOES NOW
The queue lived in the repository	It lives in the job store, which relocates onto a Railway volume by itself. A course now survives a redeploy.
Worse: a developer's queue was shipped inside the image	Our build admitted the whole orchestrator directory, so every redeploy did not just wipe production's queue — it replaced it with a build-time snapshot of a laptop , blocked items and all. Two lines of build config; it is excluded now.
A lesson mid-build was never marked as started	It sat at <code>queued</code> for its whole 30-minute build, so a restart could not tell it from one that had never begun, re-picked it, and the first attempt's spend vanished with no record. It is claimed before anything is paid for.
A restart used to lose the course	On boot we fold the queue. A lesson caught mid-build is parked as <code>blocked</code> with <code>interrupted: true</code> and waits for a person — approving it <i>rebuilds</i> it rather than publishing a video that was never rendered.

The honest claim is bounded, not absolute. The render working directories are stripped from our image and do not come back, so resuming a half-built lesson is not possible — only restarting that one. **A redeploy costs at most the single lesson in flight (about \$1.50 and 30 minutes), never the course.** Until Aroma attaches the volume, `GET /api/v1/health` reports `courses.durability: "container"` and the 404 body tells you the same thing rather than asserting the worst case. It no longer cites a handoff you do not have.

3 · The course API, and the things the handoff does not answer

The attached document covers the request and response shapes. These are the gaps you listed that it genuinely does not cover — answered here so it is one round, not three.

YOU ASKED	ANSWER
Is the plan persisted?	No. Hold it yourself and echo it back to <code>build</code>. We keep nothing between <code>plan</code> and <code>build</code> ; if your user navigates away, it is gone.
What must <code>confirmLessons</code> match?	A count — the number of entries in <code>modules[].lessons[]</code> . Not a hash, not a list. A mismatch returns <code>409 confirmation_required</code> carrying the real count and the estimate, which is the guard working, not an error.
What is charged, and when?	Per lesson, as each is released — never the whole course up front. A course stopped after lesson two has cost two lessons.
Does <code>build</code> accept <code>Idempotency-Key</code> ?	No. Only <code>/produce</code> does. <code>build</code> is guarded by the <code>confirmLessons</code> echo plus duplicate-slug rejection — a repeated build returns <code>202</code> with the duplicates listed in <code>rejected</code> , not a second course. If you would rather have the key, say so; it is small.
Does <code>callbackUrl</code> work for courses?	Not yet — it is accepted on <code>POST /demo/make-video</code> only. Courses are poll-only today. Tell us you want it and it is the same signed-webhook path.
Is a reject recoverable?	A rejected lesson is terminal and the course stops; nothing after it is built. Lessons already built and approved stay published. Re-planning is how you restart.
Is <code>by</code> attributed per tenant?	Yes, the same as <code>/demo/make-video/:id/approve</code> — the tenant comes from your credential, and the name you send rides alongside it.

One you would have found the moment you called it.

Per-lesson `approve` and `reject` — the whole mechanism by which a course pauses for a human — **threw `TypeError` on every call**. They reached for a queue function that was never exported. Nothing you did wrong, and nothing you could have seen from the outside: the route existed, was documented and was authenticated. It is fixed and covered by tests. You were right not to call a paid endpoint to find out.

4 · Tenancy, the ceiling, and the token

You read `/demo/spend` correctly. `default` is the shared credential, not an identity, and your spend has been in the same bucket as ours.

ITEM	STATE
Your own tenant	Minted as <code>taleemabad-u</code> , with its own rate limits and its own ledger. Aroma sets it in Railway; it is one variable.
Monthly ceiling	\$50 a month , enforced <i>before</i> a run starts rather than after, so a <code>402</code> is never a surprise. <code>/demo/spend</code> will show <code>remainingUsd</code> against it.
Token rotation	Overdue, and worse than you knew — see below.

Your \$0.60 per video is about 2.5× under our real cost.

A lesson costs us roughly \$1.50. Your platform-wide \$10 a month therefore buys about six lessons, not sixteen — and a single eight-lesson course would hit your own wall before it finished. That is your budget to set, not ours, but we would rather you knew the number than discovered it mid-course. The \$50 ceiling above is about 33 lessons.

The token was more exposed than "it reached you by chat".

It was also written into the handoff documents, committed, and rendered into the PDFs we sent. It is scrubbed from the sources and the attached PDFs are rebuilt clean — but it remains in our history and in any older copy, so **the rotation is not optional and the old value should be treated as public**. The replacement will reach you separately, not in a document and not in chat. We are also minting you a staging credential so you never have to test against the one that spends.

5 · Corrections, in both directions

ITEM	ANSWER
The attempts endpoint / PDF §6	You are right, and it was already fixed on 8 September — your copy predates it. The current document says the endpoint returns 501 deliberately and that the LMS owns the learner and the gradebook. We agree with your reading entirely. Corrected copy attached.
explanationsAuthored: 0 on 15 rows	All 13 popup rows are authored ; every row reporting 0 is an older on-screen one. Read explanationSource : "video-note" means the six-word caption and that the video still needs one written. It is content debt on our side and we are not going to pretend otherwise.
deliverableOnServer: false	Unchanged and will stay so — the .mp4 files are stripped from the image. Your reading of the residual risk is correct.
Create limit: per IP or per tenant?	Per tenant , keyed on your credential, with per-IP only as a backstop for anonymous callers. You can drop your self-imposed 5/hour gate.

Six rows you are currently refusing to link are safe. That was our fault too.

You wrote that you refuse to bind a block to an ephemera1 row, and that there were six. All six are in fact committed and durable — the manifest that answers the question was built before those videos were added and had gone stale, so finished work reported itself as disposable. It is rebuilt, and the pre-push gate now fails if it ever drifts again. One ephemera1 row remains, and it is a test fixture you should ignore.

6 · series → module mapping, proposed

Ours to send, and overdue. Note it is five content series, not six — made/ is runtime-generated and testing/ is a fixture; neither belongs in a university module map. Tell us the module numbers you want and we will conform to them.

SERIES	VIDEOS	PROPOSED MODULE
agentic-workflows	1	Orchestration
harness	6	Agentic harnesses
autonomy	4	Autonomy and guardrails
self-healing	6	Self-healing systems
notion-slack	13	Module 14 — connecting your tools

7 · Your list, and where each item stands

#	ITEM	STATE
1	<code>on-screen</code> correct?	Answered. Yes — the spec used a pre-popup example. Ours.
2	Course durable? Handoff?	Fixed + attached. Needs the volume.
3	Course API document	Attached, gaps answered in §3.
4	Mint your tenant	Built. Aroma to set in Railway.
5	Monthly ceiling	\$50/month, with #4.
6	Rotate the token; staging credential	Aroma, now. Treat the old one as public.
7	<code>youtubeVideoId</code>	<code>null</code> everywhere, honestly. We have two publish records and neither is a video with a checkpoint. Everything published from now on carries it; we will not fabricate a backfill.
8	Per-IP or per-tenant?	Per tenant. Drop your gate.
9	Job state across a redeploy	Same answer as courses: durable once the volume is attached.
10	<code>series</code> → module	Proposed above. Your call on numbering.
11	August content-write schema	Still open. Thirty-nine days, and still ours.
12	PDF §6	Fixed 8 Sep; you had a stale copy.
13	Answer-before-continue	Yours, in progress. The flags now agree with it.

Two things are waiting on Aroma rather than on a commit: **attach the Railway volume** (courses are not durable until it exists) and **set the tenant variable and rotate the token**. Everything else in this document is built and tested. Thank you for the correction in your §5 — you were right, and you were right to say so plainly.
