

Set Up Your Development Environment

Session 1 • Practical Assignment

Instructions:

- Watch Video 3 (Your Development Environment: Cursor, Claude Code & GitHub)
- Complete all three steps below
- Submit a single screenshot for each step as proof of completion

Assignment:

Follow the setup from Video 3 and get your environment running.

Step 1 — Install Cursor

Download and install Cursor from cursor.com. Open it and confirm it loads. Take a screenshot of the Cursor editor open on your machine.

Step 2 — Connect Claude Code

Install the Claude Code extension inside Cursor and enter your Anthropic API key. Take a screenshot showing Claude Code active in the Cursor sidebar or extensions panel.

Step 3 — Create a GitHub Repository

Create a free GitHub account (if you don't have one), create a new private repository, and connect it to a local folder in Cursor using the terminal commands shown in the video. Take a screenshot of your terminal showing the git remote add origin command completed successfully.

Reflection (optional — 2–3 sentences):

What was the hardest part of the setup? What would you do differently next time?

Submit your three screenshots via a Drive link by the deadline.
