

Agentic AI Mastery

Session 1 • Theory Assignment

Consumer vs. Producer: Agent Fundamentals & Design

Type: Theory Assignment	Session: 1
Date Assigned: May 14, 2026	Time Estimate: Varies

Overview

After watching the introductory videos on Agentic AI fundamentals, this assignment asks you to synthesize the core concepts and apply them to real-world scenarios. You'll explore the distinction between AI consumers and producers, understand agent capabilities and limitations, and design an agent system for a practical use case.

Learning Objectives

- Articulate the difference between consumer and producer mindsets in AI usage
- Identify the key capabilities and limitations of AI agents
- Understand autonomy levels and how to build trust in agent systems
- Design multi-agent architectures for complex workflows
- Recognize the boundaries between automated and human-driven processes

Instructions

1. Watch Session 1 Videos 1 and 2 (Cohort Introduction and What is an AI Agent)
2. Complete all reflection questions below in 1-2 sentences each
3. Write a 500-word case study analyzing one of the examples from the videos
4. Design a simple multi-agent system for a problem in your organization
5. Submit your response as a Word document or PDF by the deadline

Questions & Tasks

- Q1:** Define the consumer vs. producer distinction for AI as explained in the cohort introduction. How does this apply to your current role?
- Q2:** The videos show three autonomy levels (level 1: full review, level 3: independent execution, level 5: fully autonomous). For a task in your workflow, which level would you target first and why?
- Q3:** Rumi (Fahad's agent) autonomously replied to a technical email without explicit instruction. What does this demonstrate about agent capability, and what are the risks of such autonomy?
- Q4:** The curriculum emphasizes that "agents can research and execute, but they cannot build trust." Give an example from your domain where this boundary matters.
- Q5:** Name three tasks from your work that an agent could handle autonomously (level 4+). What guardrails would you need?

Evaluation Rubric

Criterion	Excellent (4)	Good (3)	Developing (2)	Needs Work (1)
Conceptual Understanding	Explains consumer/producer distinction with a unique connection to their role	Clearly explains distinction	Explains basic concepts	Partial understanding
Case Study Analysis	Thorough problem analysis, identifies key agents and their interactions	Clear problem analysis, identifies key agents	Identifies basic concepts	Superficial analysis
Multi-Agent System Design	Sophisticated architecture, clear agent roles, and interaction protocols	Clear agent roles and interactions	Identifies agents, but interaction protocols are weak	Poor agent definitions and interactions
Reflection Questions	All answered thoughtfully with personal applications	All with personal applications	Most answered; some lack depth	Incomplete or superficial responses
