

Agent Loop Feedback Task

Week 3 · The Mindset Shift — Practical Assignment (SLO 1.7: the Agent Loop)

GOAL

Show that you understand how an autonomous agent improves through a **feedback loop** — not by answering once, but by acting, seeing what happened, and adjusting.

TASK

Use **Claude Code** to create a file named `agent_loop.md`.

In the file, explain this simple agent loop:

EXAMPLE SCENARIO

A learner named **Ayesha** has not logged in for **9 days** and has completed only **1 out of 4** assignments.

The agent first recommends:

“Send Ayesha a reminder email.”

Then feedback comes in:

“Ayesha did not respond to the email.”

Now the agent must **improve** its next action.

WHAT TO INCLUDE IN YOUR FILE

1. What did the agent **observe**?
2. What action did the agent **recommend first**?
3. What **feedback** did the agent receive?
4. How did the agent **improve** the next recommendation?
5. In 2–3 lines, explain how this is **different from a normal chatbot**.

CLAUDE CODE PROMPT

Copy this into Claude Code to get started:

PROMPT

“Create a file named `agent_loop.md`. Explain the agent loop using Observe, Decide, Act, Get Feedback, and Improve. Use this example: Ayesha has not logged in for 9 days and completed only 1 out of 4 assignments. The agent first recommends sending a reminder email. Then feedback shows that Ayesha did not respond. Show how the agent improves its next recommendation. Keep it simple and beginner-friendly.”

SUBMISSION

Submit the file by **pushing the project commit to GitHub**.

*Remember: the power of an agent isn't the first answer — it's what it does with the feedback. A chatbot stops at “Act.”
An agent keeps looping: Observe → Decide → Act → Get Feedback → Improve.*
